

## Speaker information

### General Information

<b>Name</b>	Filippo Cottiglia	
<b>Email</b>	cottiglf@unica.it	
<b>Contact Number</b>	+390706758979	
<b>Affiliation</b>	Department of Life and Environmental Sciences, University of Cagliari	
<b>Education Background</b>	<p>He graduated at the University of Cagliari (1993) in Medicinal Chemistry and Technology with 110/110 points, summa cum laude. In 1997 he reached a PhD degree in Medicinal Chemistry, University of Cagliari, under the supervision of Prof. Leonardo Bonsignore. In 1998-1999 awarded postdoctoral exchange of study grant at the University of Cagliari. In 2000 he was awarded the title of Specialist in Industrial Pharmacy, University of Pavia, Italy. In 2000-2001 he was postdoctoral fellow in the group of Prof. Dr. Otto Sticher, Pharmacognosy and Phytochemistry, Institute of Pharmaceutical Sciences, Swiss Federal Institute of Technology (ETH) Zurich, Switzerland. He was appointed Assistant Professor of medicinal chemistry in 2002. Since 2019 Associate Professor in Medicinal Chemistry at the Department of Life and Environmental Sciences, University of Cagliari.</p>	
<b>Research Interest</b>	<p>His research focuses on isolation, structure elucidation and biological screenings of natural products from medicinal plants. In particular, he is interested in metabolites which show antitumor, anti-inflammatory and antiviral activity, as well as interaction with cannabinoid and GABA receptors. In particular, he has a long-standing experience in chromatographic techniques and a deep knowledge in NMR experiments devoted to the structure elucidation of natural compounds including one dimensional (<sup>1</sup>H and <sup>13</sup>C NMR, APT) and two dimensional NMR (COSY, HSQC, HSQC-TOCSY, HMBC, NOESY, ROESY). He is also interested in HPLC enantioseparation of racemic mixtures and synthesis and semi-synthesis of natural products analogues.</p>

## Speech Topic and Abstract

**Title:**

Natural product-inspired GABA receptor complex modulators

**Abstract:**

$\gamma$ -Aminobutyric acid (GABA) is the major inhibitory neurotransmitter in the vertebrate central nervous system and interacts physiologically with two types of receptors, designated GABA<sub>A</sub> and GABA<sub>B</sub>. GABA<sub>A</sub> receptors are ligand-activated Cl<sup>-</sup> channels, whereas GABA<sub>B</sub> receptors are coupled to G proteins. GABA<sub>A</sub> receptor full agonists exhibit anxiolytic, hypnotic, and anticonvulsant activities. On the contrary, the metabotropic GABA<sub>B</sub> receptors mediate slow inhibitory transmission and regulate the presynaptic release of GABA. GABA<sub>B</sub> agonist and allosteric modulators show antispastic activity and are effective in treatment of alcohol abuse and drug addiction.

The Ayurvedic plant *Withania somnifera* is used to treat various neurological disorders, insomnia, anxiety, stress, and behaviour-related problems. Both clinical and animal studies have supported the traditional use of *W. somnifera* as an antistress and anxiolytic remedy.<sup>1,2</sup> Recently, we identified from the methanol extract of the roots of *W. somnifera* a secondary metabolite, docosanyl ferulate (DF), able to enhance the GABA<sub>A</sub> receptor inhibitory postsynaptic currents.<sup>3</sup> Further studies on mouse behavioural models demonstrated that DF exerts anxiolytic effects modulating the GABA<sub>A</sub> receptor complex activity by interacting with the benzodiazepine binding site.<sup>4</sup> Moreover, at the full anxiolytic dose of 2 mg/kg, DF lacks typical benzodiazepine-like side effects on motor and cognitive performances and on place conditioning.<sup>4</sup>

In the light of the interesting results showed by the natural product DF, we synthesized a series of heterocyclic DF analogues. The new compounds were able to modulate the GABA receptor complex, even though with a different mechanism respect to that of DF.
