

## Speaker information

### General Information

<b>Name</b>	Michele Schlich		
<b>Email</b>	<a href="mailto:michele.schlich@unica.it">michele.schlich@unica.it</a>		
<b>Contact Number</b>	+39 070 675 8977		
<b>Affiliation</b>	University of Cagliari		
<b>Education Background</b>	Master's Degree in Pharmaceutical Chemistry and Technology PhD in Life, Environmental and Drug Sciences		
<b>Professional Appointment</b>	Assistant Professor of Pharmaceutical Technology		
<b>Research Interest</b>	Drug delivery systems, lipid nanoparticles, nucleic acid delivery, nanocrystals, microfluidic production of nanomedicines		
<b>Website (if any)</b>	<a href="https://web.unica.it/unica/page/it/michele_schlich">https://web.unica.it/unica/page/it/michele_schlich</a> <a href="https://x.com/MicSchlich">https://x.com/MicSchlich</a>

## The 2nd Symposium on Drug Discovery

July 2<sup>nd</sup> – 3<sup>rd</sup>, 2024 | Taipei, Taiwan

### Speaker information

#### Speech Topic and Abstract

##### Title:

Transforming molecules into medicines with drug delivery nanotechnologies: case studies on lipid-based nanoparticles

##### Abstract:

The majority of new chemical and biological entities in the discovery pipelines suffers from one or more biopharmaceutical drawbacks, including poor aqueous solubility, instability due to chemical or enzymatic degradation, and limited accumulation to the target tissues/cells for the presence of biological barriers. Drug delivery strategies can be designed and implemented to tackle these and other drawbacks, maximizing the efficacy of the drug by protecting, transporting, and releasing it to the target site and/or by minimizing off-target accumulation. In the last decades, the use of nanotechnologies for drug delivery opened unforeseen possibilities and led to the establishment of a new concept – nanomedicine – that includes several products currently on the market and in clinical use. This talk will be focused on lipid-based nanoparticles, one of the most studied and most successful categories of nanomedicines. After an overview on the functioning principles and examples of clinical translation, I will present the results from two recent applications developed in our lab: (I) the use of lipid-based nanoaggregates to boost protein antigenicity in vaccines, and (II) the production of a liposomal adrenaline formulation to improve the neurological outcome following cardiac arrest and resuscitation.
